

ARINZE ELENASULU

Python Backend Engineer | Agentic AI Systems | LLM Tooling

London, UK | +44 7823 765497 | elenasularinze@gmail.com | GitHub: <https://github.com/haxsysgit/>

PROFESSIONAL SUMMARY

Python backend engineer with 5+ years of experience building APIs, automation systems, and data-driven software used in real business operations. My work sits around backend engineering, workflow automation, and AI systems, with a focus on reliability, clear architecture, logging, validation, and maintainable code.

Creator of **Haxaml**, an MCP-first governance layer for AI coding agents. Haxaml implements **FRAME**, a structured memory model for agentic software development covering project facts, rules, work history, impact maps, and expected next steps. This reflects my focus on moving AI beyond chat interfaces into structured, secure, and dependable engineering workflows.

CORE SKILLS

- **Backend Engineering:** Python, FastAPI, Django, REST APIs, SQLAlchemy, Alembic, API design, service architecture
- **Agentic AI and LLM Systems:** OpenAI API, LLM integration, prompt orchestration, MCP, tool-based agent workflows, agent memory, guardrails, structured context
- **Databases and Data:** PostgreSQL, MySQL, SQLite, database design, query optimisation, data pipelines, reporting workflows
- **Engineering Practice:** Logging, validation, error handling, testing, Git, Linux, Docker, deployment workflows
- **Frontend and Integration:** JavaScript, TypeScript, Vue.js, React, backend/frontend integration, admin dashboards

PROFESSIONAL EXPERIENCE

Software and Data Engineer / IT Manager

Vigilis Pharmacy, Lagos | June 2023 to February 2026

- Designed and built a POS and pharmacy management system used in daily operations, covering sales, inventory, payments, reporting, and role-based access.
- Built backend workflows for invoice handling, stock updates, cashier confirmation, payment tracking, and operational reporting.
- Developed API-driven features that reduced manual paperwork, improved transaction accuracy, and made daily reconciliation easier for staff.
- Worked directly with pharmacy users to turn real operational processes into reliable software workflows.
- Added logging, validation, and backend rules to make the system easier to maintain and safer to use day to day.

AI and Backend Engineer

Bucca Hut | Contract, concurrent | February 2025 to May 2025

- Built an AI-powered sales insight system that analysed product and revenue data to suggest practical business improvements.
- Designed backend data pipelines to process historical sales, product, and revenue data into structured inputs for analysis.
- Integrated AI-assisted outputs into an existing backend workflow without disrupting live operations.
- Focused on practical LLM use, where the backend controlled data structure, reliability, and output boundaries.

Operations Systems Engineer

Justrite Superstores, Lagos | August 2022 to April 2023

- Improved inventory and stock movement workflows by building backend processes for restocking, reconciliation, and tracking.
- Worked with store staff to replace manual, spreadsheet-heavy processes with clearer software-backed workflows.
- Reduced stock handling errors and improved processing speed through automation and database-backed tracking.

PROJECTS

Haxaml

MCP-first governance layer for AI coding agents | GitHub: <https://github.com/haxsysgit/haxaml>

- Created an open-source Python developer tool for governing AI-assisted software development across agents such as Claude Code, Codex, Copilot, Cursor, Windsurf, and Gemini.
- Designed and implemented FRAME, a structured project memory model covering Facts, Rules, Acts, Map, and Expect.
- Built MCP-first workflows that allow agents to retrieve project context, follow rules, validate state, track work, and record decisions.
- Implemented CLI and MCP tooling for project initialization, validation, context building, agent instruction exports, governed task tracking, and project adoption.
- Focused on reducing context drift, stale instructions, repeated rediscovery, and unsafe agent changes.

Pharmax

POS and inventory system for community pharmacy workflows

- Built a pharmacy-focused POS and inventory management system based on real operational needs.
- Designed workflows for sales, cashier payment confirmation, stock deduction, product management, reporting, and user roles.
- Implemented backend logic using FastAPI, SQLAlchemy, Alembic, JWT authentication, and role-based access control.
- Focused on reliability, speed of use, and workflow accuracy for day-to-day pharmacy operations.

AI Basket Builder

AI-assisted product recommendation demo

- Built an AI-assisted retail basket interface that helps customers describe what they need and receive structured product recommendations.
- Designed the system around controlled product data, guided recommendations, and safe AI-assisted responses.
- Used a hybrid approach where business rules handled product matching and the AI layer improved the conversational experience.

Autopahe

Automation and scraping tool

- Built a Python command-line tool for searching, downloading, streaming, and organising anime from external websites.
- Designed the tool to handle unstable sources using retries, persistent state, and resilient scraping workflows.
- Used Python, Playwright, Requests, BeautifulSoup, CLI design, and automation patterns.

EDUCATION

BSc Information Technology

Middlesex University, London | Expected May 2026

Advanced Diploma in Software Engineering

Aptech Computer Education, Lagos | August 2024

ADDITIONAL INFORMATION

- Strong interest in agentic AI, backend architecture, AI governance, and production-grade LLM systems.
- Comfortable explaining technical ideas to both technical and non-technical users.
- Experienced turning messy real-world business problems into structured backend systems.
