PROFESSIONAL SUMMARY

Backend-focused software engineer graduating in May 2026, with hands-on experience building APIs, automation tools, database-backed systems, and AI-powered features for real business workflows.

I enjoy turning messy operational problems into clean, reliable software that people can actually use day to day. Strongest around Python, FastAPI, databases, backend logic, debugging, and building systems with enough structure to survive past the first demo.

SKILLS

Programming: Python, JavaScript, SQL

Backend Development: FastAPI, Django, REST APIs, API design, authentication, backend services

Databases: PostgreSQL, MySQL, relational database design, query optimization

Computer Science: Data structures, algorithms, object-oriented design, complexity analysis, operating systems fundamentals

AI and Automation: OpenAI API, LLM integration, prompt design, workflow automation, MCP-based tooling

Engineering Practices: Git, Linux, Docker, debugging, error handling, logging, documentation

Frontend: Vue.js, React, Tailwind CSS

EDUCATION

BSc Information Technology

Middlesex University, London

Expected May 2026

Advanced Diploma in Software Engineering

Aptech Computer Education, Lagos

August 2024

EXPERIENCE

Software and Data Engineer / IT Manager

Vigilis Pharmacy, Lagos

June 2023 to February 2026

- 1.) Designed and built a proprietary POS and pharmacy management system used in daily pharmacy operations.
- 2.) Built backend workflows for inventory tracking, sales, payments, reporting, user roles, and stock updates.
- 3.) Worked directly with pharmacy staff to understand the real workflow, then turned manual processes into software that made daily operations faster and less error-prone.
- 4.) Added validation, audit logging, and structured backend logic to make the system more reliable for sensitive pharmacy tasks.

Operations Systems Engineer

Justrite Superstores, Lagos

August 2022 to April 2023

- 1.) Improved inventory and stock movement workflows by building backend processes for restocking, reconciliation, and operational tracking.
- 2.) Helped move store operations away from manual spreadsheet-heavy processes into more structured, database-backed workflows.

- 3.) Worked closely with staff to spot recurring process issues and turn them into cleaner automation flows.
-

PROJECTS

Haxaml | AI Agent Governance and MCP Tooling

- **GitHub:** <https://github.com/haxsysgit/haxaml>
- 1.) Built a Python-based governance tool for AI-assisted software development, designed to give coding agents a consistent source of project truth.
- 2.) Designed FRAME, a structured model for project facts, rules, active work, expectations, and module mapping.
- 3.) Built CLI workflows for project initialization, validation, context loading, health checks, execution runs, and task recording.
- 4.) Added MCP-focused workflows so tools like Codex, Claude Code, Cursor, Windsurf, and Copilot-style agents can work from the same project context.
- 5.) Focused on solving context drift, messy agent handoffs, and the “AI forgot what we were building” problem that appears in longer projects.

Pharmax | Proprietary Pharmacy POS and Inventory System

- 1.) Built a FastAPI-based POS and inventory system for pharmacy workflows including sales, cashier payment confirmation, stock deduction, reporting, and role-based access.
- 2.) Designed relational database models for products, invoices, stock adjustments, payments, users, roles, and audit logs.
- 3.) Created a workflow where sales staff prepare invoices, cashiers confirm payment, and stock is deducted only after payment is completed.
- 4.) Focused on reliability, clear backend rules, and real-world usability for a busy pharmacy environment.

AI Basket Builder | AI-Assisted Retail Recommendation Demo

- **GitHub:** https://github.com/haxsysgit/Aibasket_demo
- 1.) Built an AI-powered shopping assistant that helps customers build baskets through guided conversation.
- 2.) Developed a FastAPI backend with a hybrid recommendation flow combining OpenAI GPT-4o-mini and deterministic ranking logic.

- 3.) Added validation so AI-selected products must exist in the real catalogue before being shown to the user.
- 4.) Built support for multiple store types, conversational follow-ups, curated upsells, and fallback recommendations when the AI layer is unavailable.
- 5.) Created a Vue and Tailwind frontend with an AI reasoning panel to make the recommendation flow easier to understand.

Autopahe | Python Anime Search, Download, and Streaming Tool

- **GitHub:** <https://github.com/haxsysgit/autopahe>
- 1.) Built a cross-platform Python CLI tool for searching, downloading, streaming, and organising anime from AnimePahe.
- 2.) Added support for single episodes, episode ranges, full-season shortcuts, streaming quality selection, and external players like VLC and MPV.
- 3.) Built resume, cache, and collection management features to make downloads more reliable when sources fail or connections drop.
- 4.) Added Docker support and helper scripts so the tool can run more consistently across different environments.
- 5.) Published the project as an installable Python package with practical CLI commands and setup documentation.
